

Notes for developer:

Desktop version low priority. Mobile layout TOP priority – Should feel like a polished app, with proper scrolling and dropdowns. Should feel like Apple iPhone Settings Menu.

Should accomodate Dynamic Islands and camera bumps in layout – neither should obstruct or break the design or push the header too large.

Theme updates should update APP themes in real time, but changes only appear on screens after Save.

All colors are based on OliToki Default Theme – any that are slightly off are on accident unless stated otherwise. Theme is source of truth. Some “desaturated” or “dark” versions of colors are used for outlines and other things, and are noted in the document.

Individual Board Authoring is COMING SOON, see example for design.

Before adding any functionality, build a non-working prototype for mobile layout testing.

Make design robust, profesionnal, well documented, systematic, industry standard, organized, and expandable.

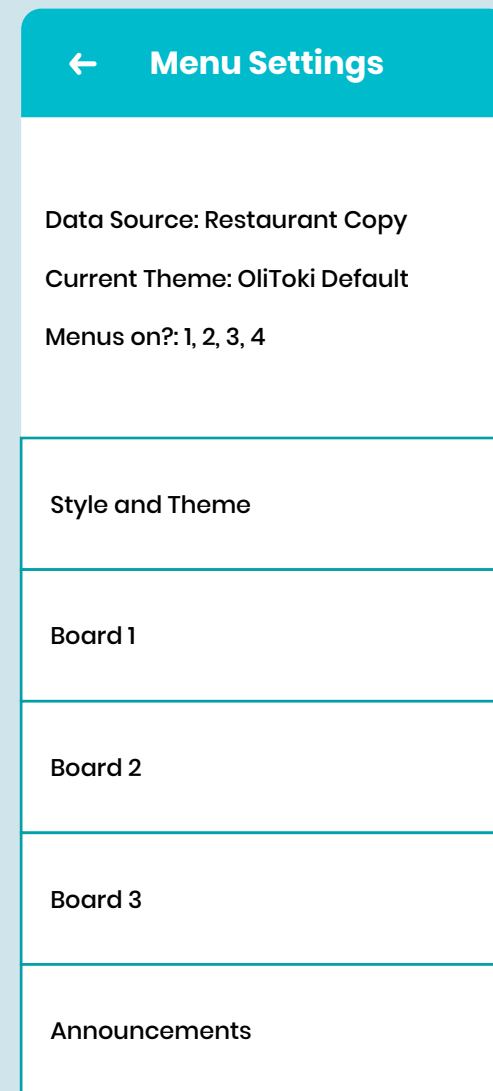

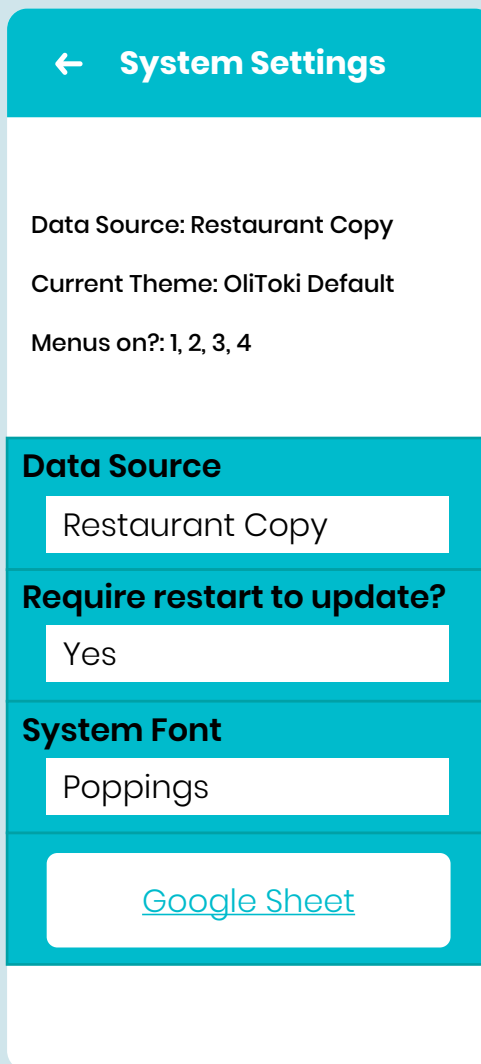

Good luck! God Bless the Process.

Notes for developer:

Application is a mobile interface for editing the OliToki Menu. App runs on our data sources in google sheets.

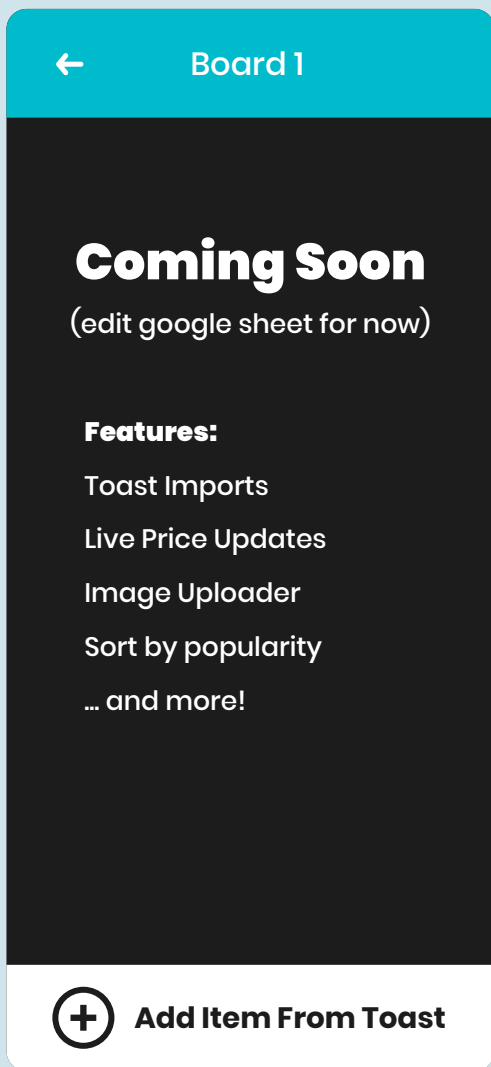

When editing Theme, app uses TEMPORARY CACHED VARIABLES that load from the selected DATA SOURCE's Style and Theme tab.

Theme of app UPDATES IN REAL TIME but does not edit the google sheet. Edits are PUSHED to the google sheet when user backs out and confirms changes.

Coming soon:

Page that teases Board editing support from within the web app.

1. STYLE AND THEME MAIN MENU

Shows editable parameters for theme. Box at top is fixed with header and previews current Presentation.

 Create New Theme

Utilizes Presentation Style and all parameters to give overview of final style, including images, patterns, scrolling backgrounds, modified Encore

2. DROPDOWN EXAMPLE

Shows Theme dropdown Selector. Header gets Main Color for box, Secondary for text. Dropdown fills view.

Currently Selected get checkmark. Dropdown BG gets Highlight Color (opacity 50%). Highlighted with Mouse gets Highlight (Special).

3. Theme Change

Theme instantly reflected in UI, application-wide implementation.

 **Create New Theme**

Note that Outlines use a slightly darker variant of our Highlight Color from our theme. We can generate these programmatically.

4. Background Selector

Combines three rows of Gsheet, BG color, BG Pattern, BG Wallpaper. Context driven - Color clears Wallpaper

Selecting Stripes reveals Scroll Speed options. Selecting Wallpaper reveals Wallpaper Image and Scroll Speed options. Colors collapse both options (since they're unused.)

5. Example of Pattern Selected in Background
Pattern Type, Pattern Color 1, Pattern Color 2, and
Scroll Speed (offscreen) are revealed as children.

 Create New Theme

There's a quarantined Gsheet that drives the theme editor. On load, it pulls from there. On save, it pushes the values to the selected Data Source sheet.

7. Example of Background Wallpaper selected
Scroll Speed is shown and updated live in the
viewport.
